GeoHive is Changing!

Since its launch several years ago, GeoHive has proved very successful in allowing a wide cross section of users share, access, view and analyses geospatial data from a variety of sources. At the last count, there are over 700 layers of authoritative data available to view overlaid on a range of OSi mapping bases.

In order to keep pace with users’ needs, OSi has been working for months on a major new upgrade and release of GeoHive.

The benefits that you’ll experience are:

- A more robust, stable platform, responding more quickly and consistently.
- A broader range of devices fully catered for, allowing wider access on desktop, tablet and smartphone devices.
- Much more intuitive user experience, with clear, logical functionality.
- A revised Data Catalogue format, so you can easily access the data layers that you want to view.
- A new auto zoom feature.
- Users can upload their own data and/or web service.
- New facility to filter the data by category, web service, feature service, image service, vector tile, KML and WMS.
- Users can also filter by date added, views, title, relevance and owner.
- When all filters are combined it allows users to drill down on the data to their specific interests.
- The new legend is easier to access and the data is presented in a more legible and more convenient manner.
- The dedicated coordinate search is more intuitive to use, users can now search for coordinates in ITM/IG/WGS84.
- Users can now add bookmarks to save various locations of interest to zoom back to later.
